

Peoples Coding Guide

Overview

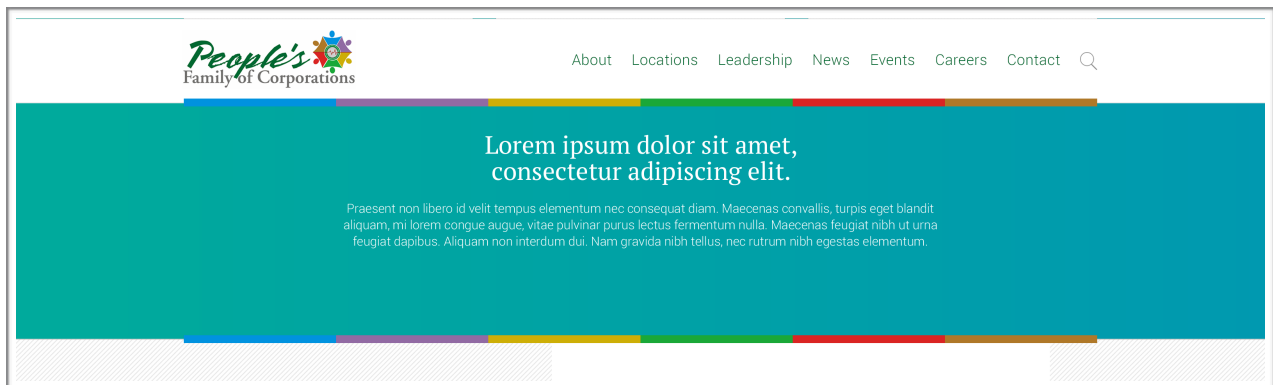

- Responsive Wordpress website on Bootstrap grid
- Website should not use any custom post types (CPT) as they are unnecessary
- All fonts are Google Fonts
- Our team will be doing some of the work once you have delivered theme files, so this is why some sections will not be developed now. My team will handle pages like "contact us" and "locations" — you will not have to do those or the map functionality you see in mockups. This is noted throughout this coding guide.
- All icons should be SVG format (which we've provided) or icon font-face. Not PNG.
- Please do not use PNG sprites on website.
- Color gradients on website use CSS gradients, not IMAGE Backgrounds. In this guide, we've given you CSS code for gradient from our mockups.
- Design includes shadows, those should all be done with CSS, not images.

// Site Header

- The header will scroll with user (sticky header)
- Header can have dropdown menu (in PSD file)
- Header search icon will open a search box on click.
- On scroll, header will reduce in height.

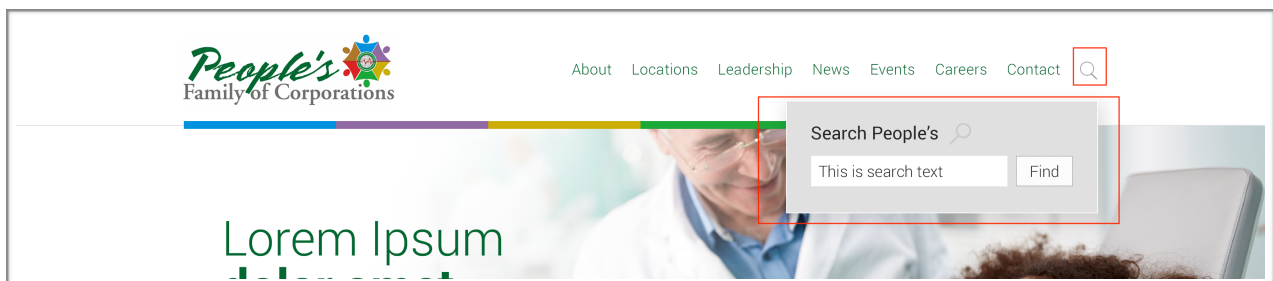

Header On Scroll

Example of header on scroll, becomes smaller in height, logo shrinks.
The multi-colored bar is part of the header.

Search Box on Click

When user clicks on search icon, it will open the search box. This will do a standard search of the website and go to a search results page with standard default page template.

Header on Landing Page

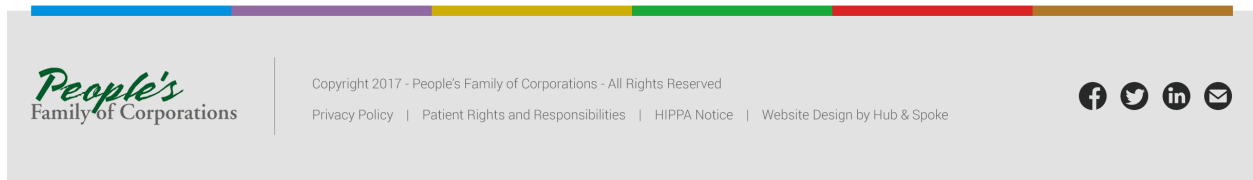

On the landing page template, we want an additional bar added above the header. This will contain a secondary menu.

// Footer

Footer includes logos for companies other brands. Each logo should link to an offsite url.

- Footer includes links to social media and a secondary menu.
- The social icons are part of SS Social Circle icon font (which we have provided).
- "Website Design by Hub & Spoke" link should not be in Theme Options panel, but hard coded in footer template file please.

// News Section

Homepage Posts

The latest three posts from the category “News” should appear on the homepage template in this area. When a user clicks “Explore More News” it takes them to the news page, which displays all posts from the “News” category.

- Please ensure both the image and headline link to the post.
- Please ensure the “Explore More News” and arrow icon both link to the “News” page.

News Page

The news page design provided should be used for the News page, category pages and tag pages (along with the general archive pages).

- This should say page title or category/tag title.
- This is breadcrumb navigation.
- Please ensure image, title and “read more” button all link to the post.

News page / category page / tag page should display 8 posts per page and have pagination.

C

Single Post or Page

The single news page and default page template share the same design.

- If there is a Featured Image, it will display. If there is NOT a featured image, it should look like the alternate version below.
- This is the page title or post title.
- This is a sidebar with widgets. Currently shown is a Custom Menu.

Single Page or Post with No Featured Image

// Services Page

The services page should use ACF with repeater fields. This needs to be a page template, not a custom post type. We should be able to have more than 3 service categories (if we choose), with the grid pattern continuing.

On the Services page, each repeating group contains:

- User selects or uploads Icon (SVG)
- User defines Service group Title
- User defines Service group Description
- User defines Service group Services (this is just a *text entry field* where we can input a list)
- User defines photo (photo should cover space and not stretch).
- Link to any page User defines on the website.

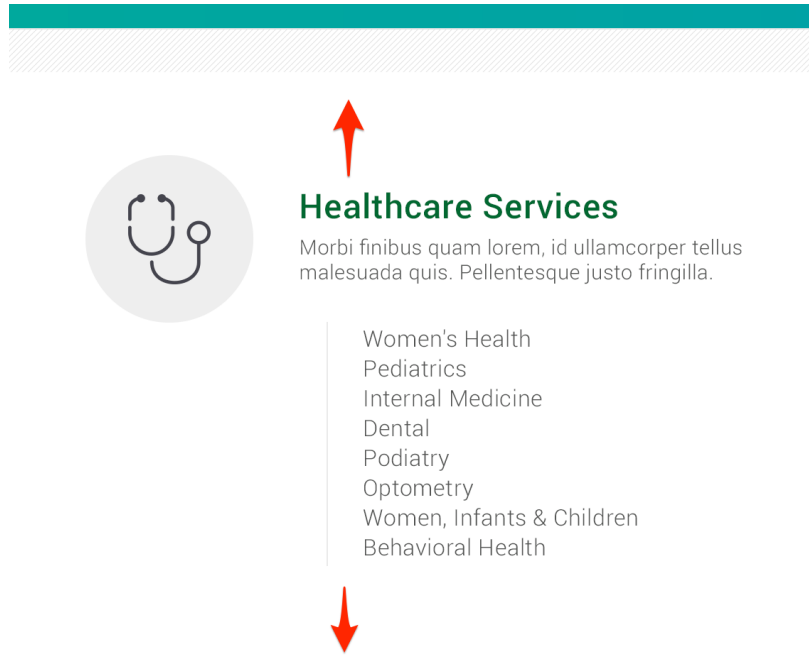

The image, icon, title and description should all link to F for each group, which can be any page on the website the user picks.

This is a small thing, but content inside each of the services groups should be vertically centered.

This can easily be accomplished with this css code:

<http://zerosixthree.se/vertical-align-anything-with-just-3-lines-of-css/>

// Homepage

- A. This area can be a single image or a slider. Right now, we just want ONE image in it. Slider should use fade transition.

The text on top of the image is the SAME for all slides. Learn more will link to a user defined page.

The **white gradient effect on the image left and bottom** should be a separate layer about the image/slider, so it can apply to all images uploaded.

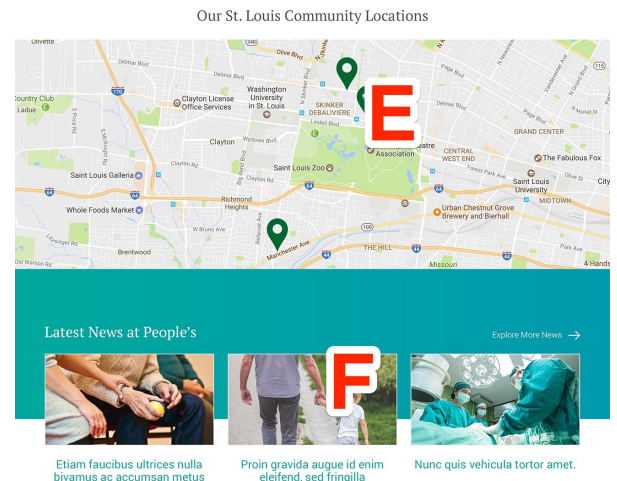

- B. These three boxes will link to OFFSITE URL's.

So we need to define for each:

1. A logo
2. Title
3. Description
4. A URL to link the entire box to

Please ensure the entire div is a link.

- C. This is the welcome text.
- D. Image with text.
- E. You are NOT responsible for coding or developing the map portion of the website. Please just include a DIV where the map would be and make it 600px high with a background color of BLACK. We will replace it with the map ourselves.
- F. This is the latest News posts, as discussed earlier in this coding guide.

// LANDING PAGE

This landing page template will be used multiple times on the website, so it's important that these elements are easy to change. It may also be used as the homepage.

A. This is an image.

Black gradient effect on right should be a separate layer above image.

White gradient on bottom is layer on top of image and not part of image.

B. These are buttons. Each landing page will have 4 of them. The first button will always be the patient portal, after that, we should be able to define:

1. Title
2. Icon (SVG)
3. Destination URL

The destination URL may be a page on the website or an offsite link.

C. Welcome text.

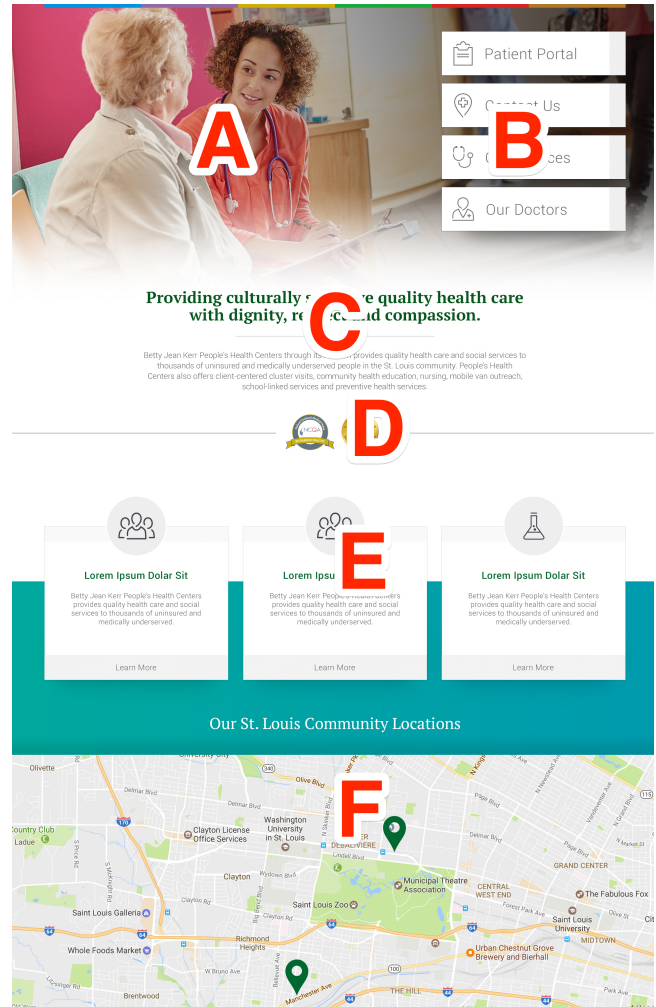

D. These are two images. User should be able to add more. These are medical certifications.

E. We should be able to define what goes in these three boxes. Boxes have hover state where entire box changes color. We should define for each

1. Icon (SVG)
2. Title
3. Description
4. Destination URL

The destination URL may be a page on the website or an offsite link.

F. Same as homepage, you are NOT responsible for coding or developing the map portion of the website. Please just include a DIV where the map would be and make it 600px high with a background color of BLACK. We will replace it with the map ourselves.

// Mobile

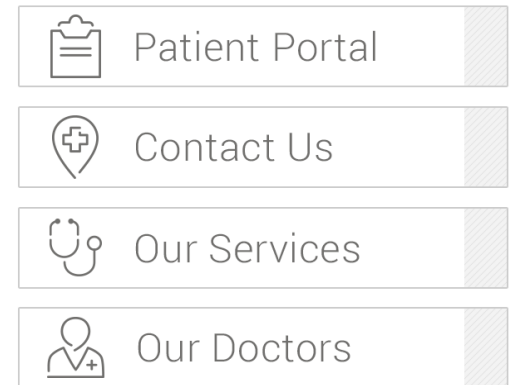

- Website should follow best practices and bootstrap standard for mobile.
- Header on mobile should NOT be fixed.

Example of landing page on mobile:

Menu icon should be SVG or CSS icon

When you select menu button on mobile, menu should appear from the right (off canvas) and be able to include multi-levels (since the website has drop-downs).

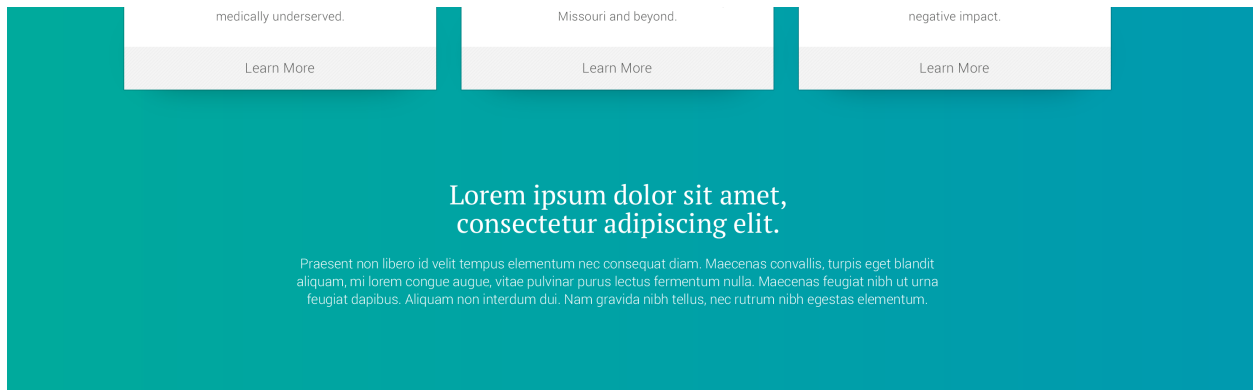

Similar to: <http://responsivenavigation.net/examples/off-canvas-slide/index.html>

**Providing culturally
sensitive quality health care
with dignity, respect and
compassion.**

// Gradient Colors

The website makes use of many gradient backgrounds:

The CSS color code for this particular color is:

```
.gradient { background: -webkit-linear-gradient(90deg, #01a99c 10%, #0698b1 90%); /* Chrome 10+,  
Saf5.1+ */ background: -moz-linear-gradient(90deg, #01a99c 10%, #0698b1 90%); /* FF3.6+ */  
background: linear-gradient(90deg, #01a99c 10%, #0698b1 90%); /* W3C */ }
```

```
background: -webkit-linear-gradient(90deg, #01a99c 10%, #0698b1 90%);  
background: -moz-linear-gradient(90deg, #01a99c 10%, #0698b1 90%);  
background: -ms-linear-gradient(90deg, #01a99c 10%, #0698b1 90%);  
background: -o-linear-gradient(90deg, #01a99c 10%, #0698b1 90%);  
background: linear-gradient(90deg, #01a99c 10%, #0698b1 90%);
```
